

iOS Take-Home Test

Objective

Build a small but production-quality iOS app that demonstrates:

- Clean architecture
 - API integration
 - Good UI/UX practices
 - Testability
 - Thoughtful engineering decisions
-

Problem Statement

Build an app called: “**Task Explorer**”

An app that allows users to:

1. Fetch tasks from a remote API
 2. View task list
 3. View task detail
 4. Mark tasks as completed (local state is fine)
-

API

Use this public API:

- <https://jsonplaceholder.typicode.com/todos>

Required fields:

- `id`
 - `title`
 - `completed`
-

Requirements

1. Core Features

- Display list of tasks
 - Show:
 - Task title
 - Completion status
 - Tap on a task → navigate to detail screen
 - Toggle completion status (locally stored)
-

2. Technical Requirements

Architecture

- Use **MVVM**, **VIPER**, or **Clean Architecture**
- Clear separation of concerns

Networking

- Use **URLSession** (or abstraction layer)
- Proper error handling
- Decodable models

UI

- UIKit or SwiftUI (your choice)
- Responsive layout
- Loading state
- Error state

Persistence

- Store completion changes locally
(UserDefaults / CoreData / in-memory with explanation)
-

3. Code Quality

- Clean, readable code
- Proper naming conventions
- Modular structure

4. Testing

- Unit tests for:
 - ViewModel / Business logic
 - Networking layer (mocked)
-

AI Collaboration Requirement

We expect candidates to **use AI tools (e.g., ChatGPT, Copilot)** as part of their workflow.

Include a short section in README:

“AI Usage Report”

- What AI tools were used?
 - What tasks were assisted by AI?
 - What decisions were made manually?
 - Any limitations or corrections applied?
-

Deliverables

Provide:

1. Git repository (GitHub/GitLab/Bitbucket)
2. README.md including:
 - Setup instructions
 - Architecture explanation
 - Trade-offs / assumptions
 - AI usage report
